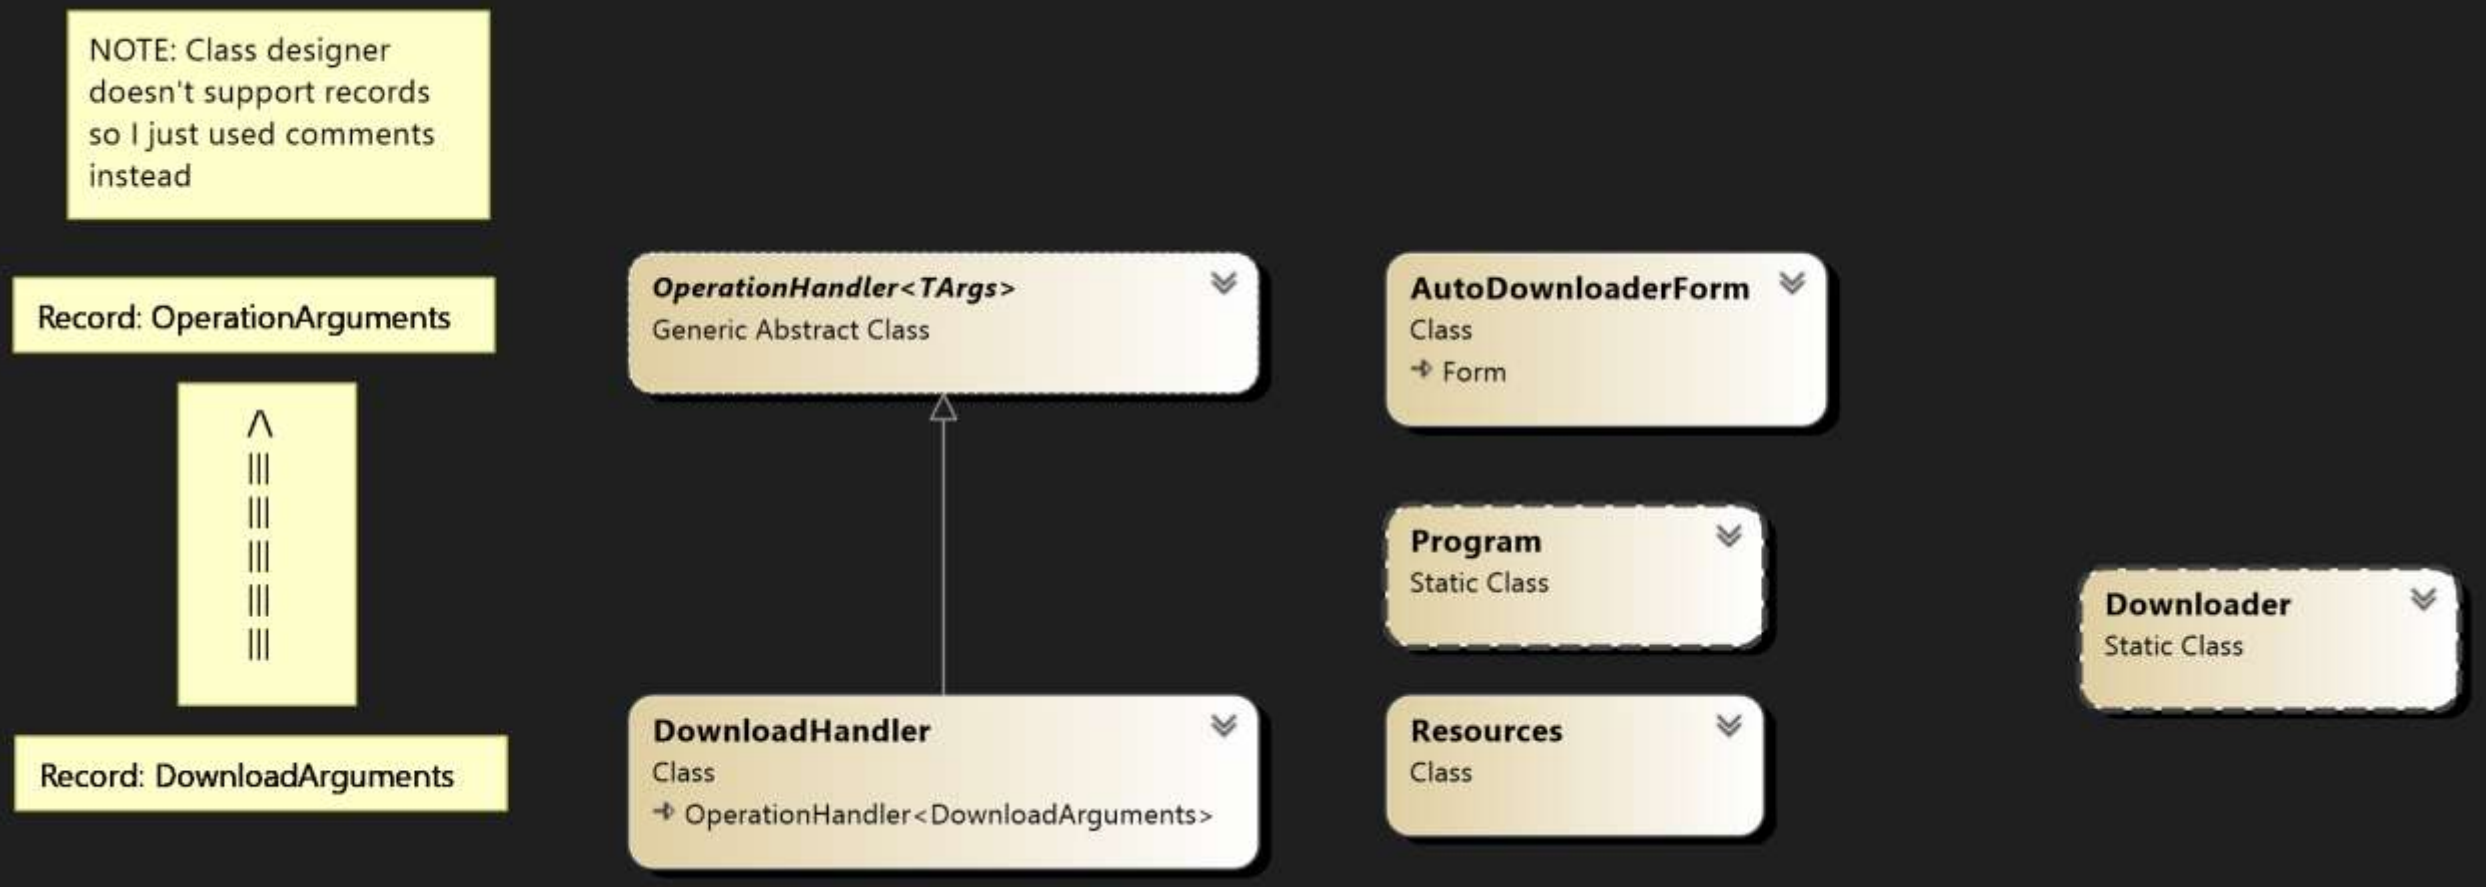
Class Diagram



Overview

The Automatic File Downloader allows you to download files from web links, allowing the user to queue and cancel downloads.

Downloader

- Handles asynchronous downloads from a given URL saving the results to a specified file.

DownloadHandler

- Acts as an intermediary between the downloader and the form.
- Handles any events from the download and triggers the form to change to represent the state of the download (in process, error, complete, etcetera).

AutoDownloaderForm

- Handles input, appearance, and creation of any new form elements.
- Passes input to the Download Handler a long with events for different states of the download.
